

CHAPTER 1

INTRODUCTION

The Student Result Management System (SRMS) is a web-based application designed to simplify and streamline the process of managing student examination results within educational institutions. By providing a user-friendly platform for administrators, teachers, and students, SRMS aims to enhance transparency, accessibility, and efficiency in result management processes. This report provides an overview of the SRMS project, including its purpose, objectives, scope, and organization overview. Additionally, it outlines the system analysis, design, and implementation details, along with conclusions and references.

1.1 PURPOSE:

The Student Result Management System (SRMS) is designed to simplify how schools and colleges handle exam results. It acts like a digital assistant that helps organize and manage student scores from tests and exams. The main goal is to ensure accuracy, save time, and make it easy for everyone to access their results whenever they need them.

1.2 OBJECTIVE:

The big aim of SRMS is to create a user-friendly system that benefits everyone involved in the education process. Teachers can input and manage results efficiently, students can access their scores easily, and administrators can oversee everything smoothly. By using SRMS, schools can streamline their result management process, reduce errors, and focus more on helping students succeed in their studies.

1.3 ORGANIZATION OVERVIEW

SRMS is meant for all types of educational institutions, from small schools to large universities. It serves as a central platform where teachers, students, and administrators can interact with exam results and related information.

Whether it's a primary school or a higher education institution, SRMS can adapt to meet their specific needs and requirements.

1.4 SCOPE OF THE PROJECT

The scope of the Student Result Management System (SRMS) project encompasses a wide range of functionalities aimed at improving the efficiency and effectiveness of result management processes within educational institutions. In addition to handling exam results, SRMS includes the following key features:

- **Student Record Management:** SRMS allows administrators to maintain comprehensive records of students, including personal information, contact details, academic history, and any other relevant data. This feature enables schools to easily track student progress and demographics.
- **Semester Management:** SRMS facilitates the management of academic semesters, including scheduling, course offerings, and academic calendars. Administrators can create, edit, and update semester information as needed, ensuring accurate and up-to-date scheduling for students and faculty.
- **Subject Management:** SRMS provides tools for managing academic subjects, including subject names, codes, descriptions, and prerequisites. This feature allows administrators to organize and categorize subjects according to departmental requirements and curriculum standards.
- **User Authentication and Access Control:** SRMS includes robust user authentication mechanisms to ensure secure access to the system. Administrators, teachers, and students are assigned specific roles and permissions based on their responsibilities and requirements, allowing for fine-grained access control and data security.

CHAPTER 2

SYSTEM ANALYSIS

2.1 REQUIREMENT SPECIFICATION:

The SRS deals with the requirement of the proposed system. It describes what the proposed System should do without describing how the System will do it. The basic objective of SRS is to specify the important requirements of the proposed system that are gathered during the system analysis. To satisfy the basic goals, an SRS should have some desirable characteristics: correctness, completeness, unambiguous, verifiable, modifiable and traceable, which we have throughout during the process in entirety.

2.2 SYSTEM STUDY

Understanding the existing processes and identifying areas for improvement is crucial for developing an effective Student Result Management System (SRMS). System study involves analyzing the current methods of managing student examination results and assessing the challenges faced by educational institutions. The following steps are involved in the system study phase of the SRMS project:

- Data gathering
- Study of existing system
- Analyzing problem
- Studying various documents
- Feasibility study for further improvements

During the initial study phase, the project team gathers information about the specific needs and challenges faced by educational institutions in managing student examination results. By studying the existing system and analyzing its shortcomings, the project team gains insights into the requirements and opportunities for improvement.

This information serves as the foundation for designing and developing a robust and user-friendly SRMS that meets the needs of stakeholders and enhances the efficiency and effectiveness of result management processes.

2.3 FUNCTION REQUIREMENT SPECIFICATIONS

The user screen be informative web page with different links and pop-ups which is simple and easy to understand all the services provided by the system.

Hardware Requirements:

| | |
|------------------------|-------------------------------------|
| Processor Speed | 2GHz |
| Processor | Intel Pentium 4 or higher processor |
| Memory Size | 1 GB RAM (minimum) |
| Storage | 80GB Hard Disk (minimum) |

Software Requirements:

| | |
|-------------------------|--|
| Front End | PHP, HTML, CSS, JAVASCRIPT |
| Back End | MYSQL(XAMPP) |
| Operating System | WINDOWS 10 AND ANY OTHER COMPATIBLE OS |

Communication Interface:

Database Connection, PHP.

CHAPTER 3

SYSTEM DESIGN

The most creative and challenging face of the system development is System Design. It provides the understanding and procedural details necessary for the logical and physical stages of development. In designing a new system, the system analyst must have clear understanding of how the output is to be produced and in what format. Second, input data and master files have to be designed to meet the requirements of the proposed output. The operational phases are handled through program construction and testing.

3.1 TABLE DESIGN

3.1.1 ADMIN (ADMIN_ID, USERNAME, PASSWORD)

| FIELD NAME | DATA TYPE/SIZE | CONSTRAINT |
|------------|----------------|-------------|
| ADMIN_ID | INT (50) | PRIMARY KEY |
| USERNAME | VARCHAR (100) | NOT NULL |
| PASSWORD | VARCHAR (60) | NOT NULL |

3.1.2 BRANCH (BRANCH_ID, BRANCH)

| FIELD NAME | DATA TYPE/SIZE | CONSTRAINT |
|------------|----------------|-------------|
| BRANCH_ID | INT(50) | PRIMARY KEY |
| BRANCH | VARCHAR(100) | NOT NULL |

3.1.3 SEMESTER (SEM_ID, SEMESTER)

| FIELD NAME | DATA TYPE/SIZE | CONSTRAINT |
|------------|-------------------|-------------|
| SEM_ID | INT(9) | PRIMARY KEY |
| SEMESTER | INT(100) | NOT NULL |

3.1.4 SUBJECTS (SUBJ_ID, SUBJ_NAME, SUBJ_CODE, STATUS)

| FIELD NAME | DATA TYPE/SIZE | CONSTRAINT |
|------------|-------------------|-------------|
| SUBJ_ID | INT(200) | PRIMARY KEY |
| SUBJ_NAME | VARCHAR(200) | NOT NULL |
| SUBJ_CODE | VARCHAR(100) | NOT NULL |
| STATUS | INT(1) | NOT NULL |

3.1.5 SUBJECT_COMB (COMB_ID, BRANCH_ID, SEM_ID, SUBJ_ID, STATUS)

| FIELD NAME | DATA TYPE/SIZE | CONSTRAINT |
|------------|-------------------|-------------|
| COMB_ID | INT(200) | PRIMARY KEY |
| BRANCH_ID | INT(50) | NOT NULL |
| SEM_ID | INT(9) | NOT NULL |
| SUBJ_ID | INT(200) | NOT NULL |
| STATUS | INT(1) | NOT NULL |

3.1.6 STUDENT (REG_ID, NAME, ROLL_NO, EMAIL, GENDER, DOB, BRANCH_ID, SEM_ID, REG_DATE, STATUS)

| FIELD NAME | DATA TYPE/SIZE | CONSTRAINT |
|------------|----------------|-------------|
| REG_ID | INT(225) | PRIMARY KEY |
| NAME | VARCHAR(200) | NOT NULL |
| ROLL_NO | INT(160) | NOT NULL |
| EMAIL | VARCHAR(100) | NOT NULL |
| GENDER | VARCHAR(50) | NOT NULL |
| DOB | VARCHAR(100) | NOT NULL |
| BRANCH_ID | INT(100) | NOT NULL |
| SEM_ID | INT(8) | NOT NULL |
| REG_DATE | TIMESTAMP | NOT NULL |
| STATUS | INT(1) | NOT NULL |

3.1.7 RESULT (RESULT_ID, ROLL_NO, BRANCH_ID, SEM_ID, SUBJ_ID, MARKS)

| FIELD NAME | DATA TYPE/SIZE | CONSTRAINT |
|------------|----------------|-------------|
| RESULT_ID | INT(200) | PRIMARY KEY |
| ROLL_NO | INT(200) | NOT NULL |
| BRANCH_ID | INT(50) | NOT NULL |
| SEM_ID | INT(9) | NOT NULL |
| SUBJ_ID | INT(200) | NOT NULL |
| MARKS | INT(110) | NOT NULL |

3.2 ENTITY RELATIONSHIP DIAGRAM

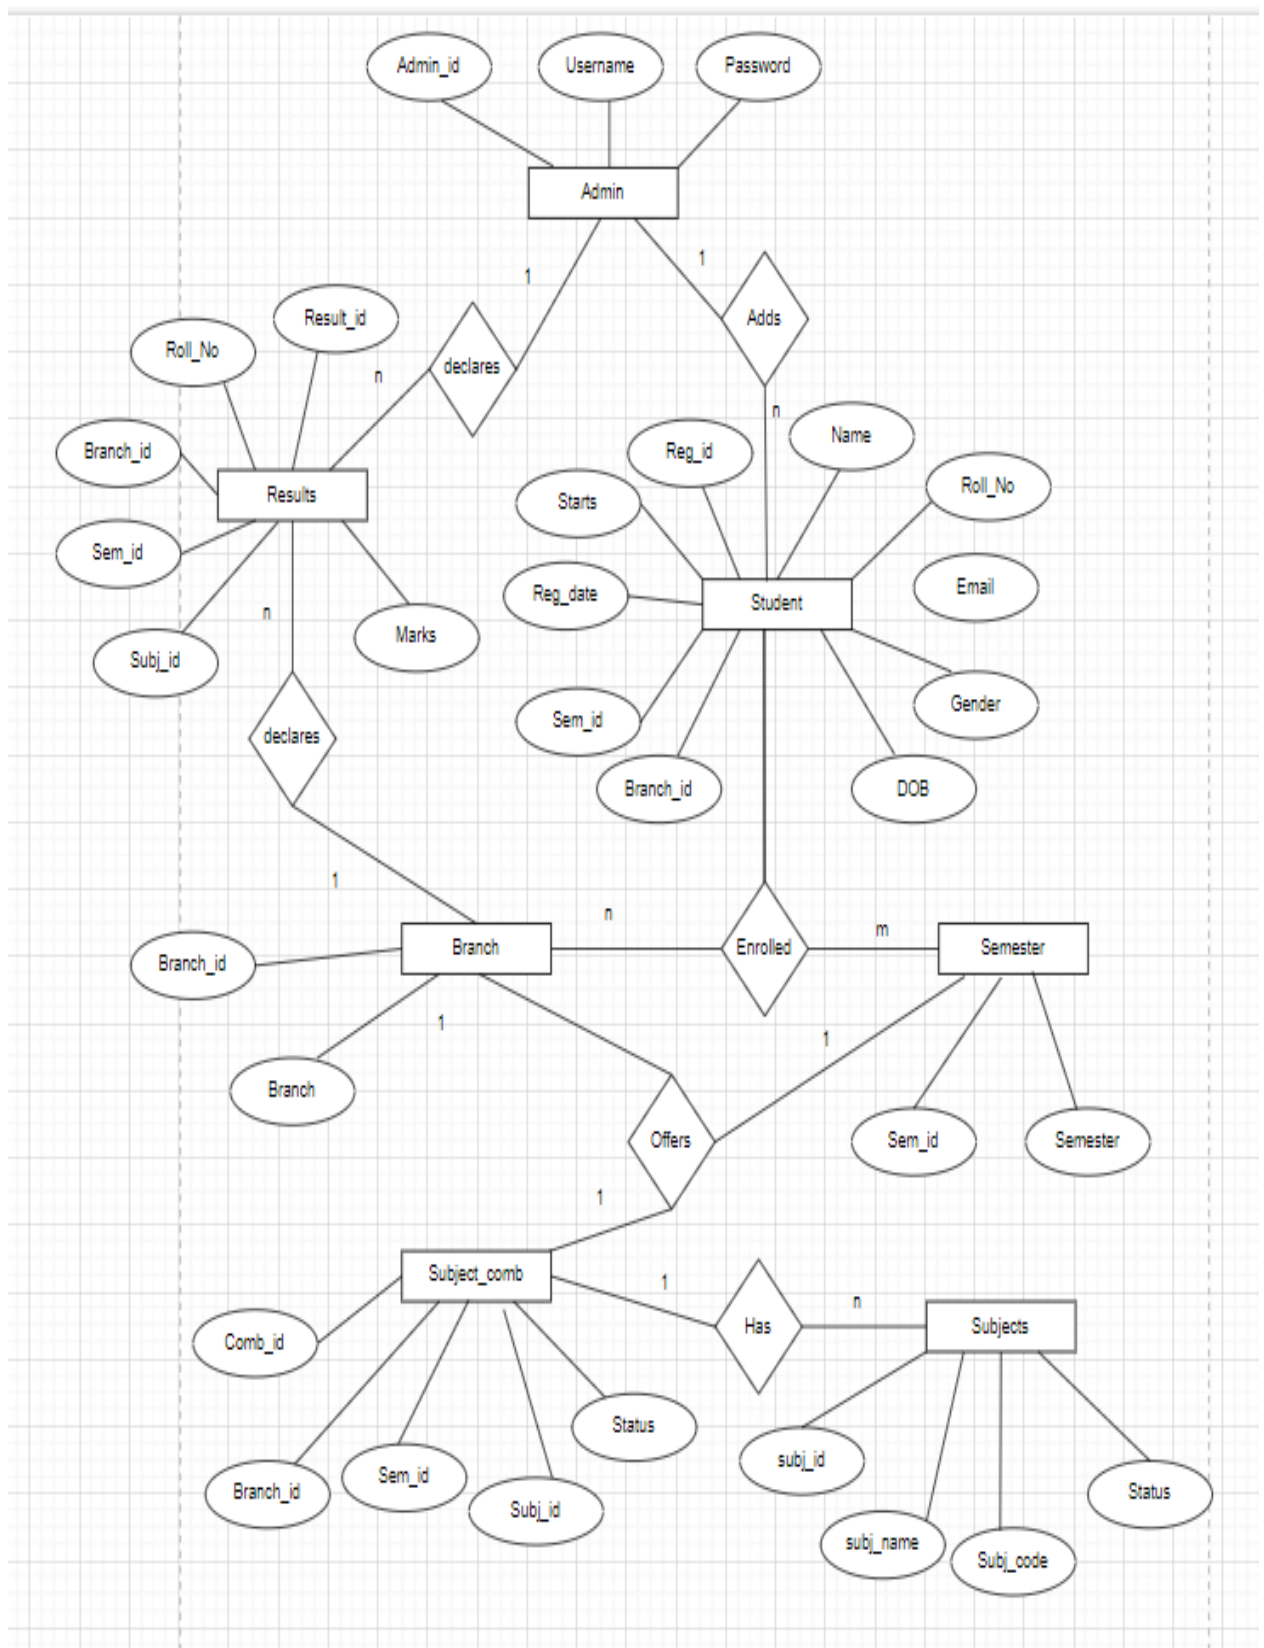

A set of primary component are identified for the E-R Diagram: data object, attributes, relationships and various type indicators. The primary purpose of the E-R Diagram is to represent data object and their relationships. Data objects: A data objects is a representation of almost any composite information that must be understood by software. Composite information refers to something that has a number of different properties or attributes.

Attributes: Attributes defines the properties of a data object and take on one of three different characteristics. They can be used to (1) name an instance of the data object, (2) describe the instance, or (3) make reference to another instance in another table. In addition, one or more of the attributes must be defined as an identifier that is, the identifier attribute becomes a “key” when we want to find an instance of the data object.

Relationship: Relationships indicate the manner in which data objects are “connected” to one another.

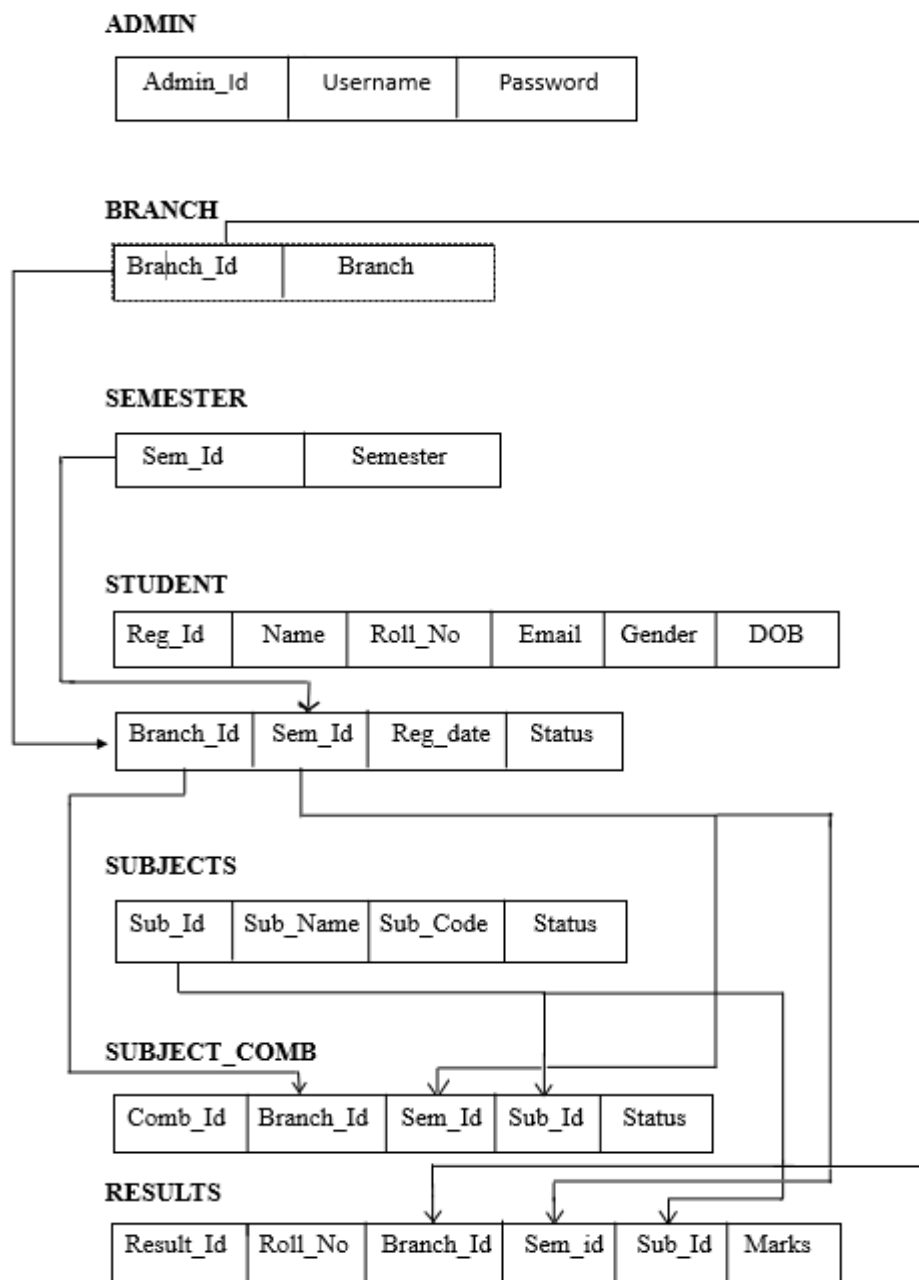

Cardinality: The data model must be capable of representing the number of occurrences objects in a given relationship. Tillman defines the cardinality of an object/relationship pair in the following manner: “Cardinality is the specification of the number of occurrences of one [object] that can be related to the number of occurrences of another [object]. Cardinality is usually expressed as simply ‘one’ and ‘many’, two [objects] can be as:

- One-to-One(1:1): An occurrence of [object] ‘A’ can relate to one and only one occurrence of [object] ‘B’, and an occurrence of ‘B’ can relate to only one occurrence of ‘A’.
- One-to-Many (1:N): One occurrence of [object] ‘A’ can relate to one or many occurrences of [object] ‘B’, but an occurrence of ‘B’ can relate to only one occurrence of [object] ‘A’.
- Many-to-Many(M:N): An occurrence of [object] ‘A’ can relate to one or more occurrence of ‘B’, while an occurrence of ‘B’ can relate to one or more occurrences of ‘A’ .

3.3 SCHEMA DIAGRAM

A database schema is the skeleton structure that represents the logical view of the entire database. It defines how the data is organized and how the relations among them are associated. It formulates all the constraints that are to be applied on the data. A database schema defines its entities and the relationship among them. It contains a descriptive detail of the database, which can be depicted by means of schema diagrams. It's the database designers who design the schema to help programmers understand the database and make it useful.

CHAPTER 4

IMPLEMENTATION

4.1 CODE(NAV.PHP):

```

At the bottom of the page, there is a "Back to Home" link.

Print Result: Student result can also be printed/saved in pdf format

The screenshot shows the same web application as before, but with a print dialog box open. The dialog box is titled "Title - Google Chrome" and shows the print settings for the document. The settings are as follows:

- Destination: Microsoft Print to PDF
- Pages: All
- Layout: Portrait
- Color: Color
- More settings: (expanded)

The dialog box also shows a preview of the document being printed, which includes the student's details and the table of subjects and marks. The "Print" button is highlighted in blue.

CONCLUSION

- The development of this system has effectively utilized practical knowledge to alleviate the efforts required by its users.
- Its user-friendly interface ensures that individuals familiar with web applications will find the system easy to navigate and utilize.
- The incremental modeling approach adopted for system development proves advantageous, allowing for easier modification and expansion of the current version. This facilitates the seamless deployment of enhanced versions following thorough testing and analysis of the existing system.
- The system's implementation has demonstrated a significant reduction in manual efforts, enhancing overall efficiency and productivity.
- Its intuitive design promotes accessibility for users of varying technical backgrounds, ensuring widespread adoption and satisfaction.
